Annex A

Public engagement themes for ‘Long Island’

Recreation

In earlier engagement sessions, participants expressed their wishes for ‘Long Island’ to provide recreational opportunities and for its green and blue spaces to support bio-diversity. These included accommodating water activities in the future reservoir, incorporating nature-based solutions to allow biodiversity to thrive, and ensuring that the future coastline supports sports and recreational opportunities. To expand on these ideas, participants will be invited to explore the types of recreational experiences that ‘Long Island’ could offer and the considerations that could guide the planning for such activities. This could include exploring how elements such as beaches and opportunities for water activities could contribute to a liveable environment, while considering how recreation can be integrated alongside other future land use and infrastructure needs.

Connectivity

Earlier feedback also reflected Singaporeans’ aspirations for ‘Long Island’ to be well-connected and accessible by sustainable transport modes. The next phase of engagement will gather ideas on how ‘Long Island’ can be connected to the rest of Singapore and how its future green and blue spaces can be made accessible. To expand on these ideas, participants will have the opportunity to explore how different forms of sustainable transport can be planned for to ensure that ‘Long Island’ is well-connected to Singapore’s island-wide transport network and within itself.

The ideas and feedback from the upcoming engagement sessions will be taken into consideration as agencies continue to refine the plans for ‘Long Island’, including the infrastructure required to support its long-term development.
